

MASx52: Assignment 3

1. Consider the binomial model with $r = \frac{1}{11}$, $d = 0.9$, $u = 1.2$, $s = 100$ and time steps $t = 0, 1, 2$.
 - (a) Draw a recombining tree of the stock price process, for time $t = 0, 1, 2$.
 - (b) Find the value, at time $t = 0$, of a European call option that gives its holder the option to purchase one unit of stock at time $t = 2$ for a strike price $K = 90$. Write down the hedging strategy that replicates the value of this contract, at all nodes of your tree.

You may annotate your tree from (a) to answer (b).

2. Let $S_n = \sum_{i=1}^n X_i$, be a random walk, in which $(X_i)_{i \in \mathbb{N}}$ is a sequence of i.i.d. random variables with common distribution $\mathbb{P}[X_i = \frac{1}{i^2}] = \mathbb{P}[X_i = -\frac{1}{i^2}] = \frac{1}{2}$.

- (a) Show that $\mathbb{E}[|S_n|] \leq \sum_{i=1}^n \frac{1}{i^2}$.
- (b) Explain briefly why part (a) means that S_n is bounded in L^1 .
- (c) Show there exists a random variable S_∞ such that $S_n \xrightarrow{a.s.} S_\infty$ as $n \rightarrow \infty$.
- (d) Determine whether (S_n) is bounded in L^2 , and briefly state what else (if anything) can be deduced about S_∞ as a consequence.
