MASx50: Assignment 3

Solutions and discussion are written in blue. Some common pitfalls are indicated in teal. A sample mark scheme is given in red, with each mark placed after the statement/deduction for which the mark would be given. As usual, mathematically correct solutions that follow a different method would be marked analogously.

Marks are given for [A]*ccuracy,* [J]*ustification, and* [M]*ethod.*

1. Let $f_n, f : [0,1] \to \mathbb{R}$. In each of the following cases, explain whether the Monotone and/or Dominated Convergence Theorems can be used to prove that $\int_0^1 f_n(x)\,dx \to \int_0^1 f(x)\,dx$.

   (a) $f_n(x) = \cos(\frac{x}{n}) + \sin(\frac{x}{n})$ and $f(x) = 1$.

   (b) $f_n(x) = \mathbb{1}_{[\frac{1}{n},1]}(x)\,x^{-1}$ and $f(x) = \mathbb{1}_{(0,1]}x^{-1}$.

   (c) $f_n(x) = \mathbb{1}_{[0,\frac{1}{n}]}(x)\,n$ and $f(x) = 0$.

   Solution.

   (a) DCT only (the MCT can't be used here because $f_n \le f_{n+1}$ doesn't hold). [1A + 1J]

   (b) MCT only (the DCT can't be used here because $\int_0^1 f(x)\,dx = \infty$). [1A + 1J]

   (c) Neither, in this case $\int_0^1 f_n(x)\,dx = 1$ and $\int_0^1 f(x)\,dx = 0$. [1A + 1J]

2. Let (S, Σ, m) be a measure space. Let $f : S \to \mathbb{R}$ be measurable and let $c > 0$. Consider the following two facts, which were stated (and proved) within the lecture notes:

   (a) $\left|\int_S f\,dm\right| \le \int_S |f|\,dm,$

   (b) $m(\{x \in S \;:\; |f(x)| \ge c\}) \le \frac{1}{c}\int_S |f|\,dm.$

   You do *not* need to prove these facts here.

   Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space and let $X : \Omega \to \mathbb{R}$ be a random variable. Let $\mathbb{E}$ denote expectation with respect to $\mathbb{P}$. Use this notation to write down probabilistic versions of statements (a) and (b).

   Solution.

   (a) $|\mathbb{E}[X]| \le \mathbb{E}[|X|]$. [2A]

   (b) $\mathbb{P}[X \ge c] \le \frac{1}{c}\mathbb{E}[X]$. [2A]

3. Consider the probability space $([0,1], \mathcal{B}([0,1]), \lambda)$ where λ denotes the restriction of Lebesgue measure to the Borel σ-field $\mathcal{B}([0,1])$ on $[0,1]$.

   Let $X_n(\omega) = \begin{cases} 1 & \text{if } \omega = 0 \\ \omega n^{3/2} & \text{if } \omega \in (0, \frac{1}{n}] \\ 0 & \text{if } \omega \in (\frac{1}{n}, 1]. \end{cases}$

   Determine in which modes of convergence we have $X_n \to 0$.

   Solution.

   We first check almost sure convergence. Fix some $\omega \in [0,1]$. If $\omega \in (0,1]$ then for all large enough n we have $\frac{1}{n} < \omega$. For such n we have $X_n(\omega) = 0$, [1M] which means $X_n(\omega) \to 0$. We thus obtain that $\{X_n(\omega) \to 0\} \subseteq (0,1]$ [1J] so

$$\lambda(\{X_n(\omega) \to 0\}) \geq \lambda((0,1]) = 1,$$

   which means that $X_n \stackrel{a.s.}{\to} 0$. [1A]

   It follows that $X_n \stackrel{\mathbb{P}}{\to} 0$ and also that $X_n \stackrel{d}{\to} 0$. [1A + 1J]

   Lastly, the expectation of $|X_n|^p = X_n^p$ is given by

$$\begin{aligned}
\mathbb{E}[X_n^p] &= \int_0^1 X_n(\omega)^p \, d\lambda(\omega) \\
&= \int_0^{\frac{1}{n}} \omega^p n^{3p/2} \, d\lambda(\omega) \\
&= n^{3p/2} \left[\frac{\omega^{p+1}}{p+1} \right]_0^{\frac{1}{n}} \\
&= n^{3p/2} \frac{(1/n)^{p+1}}{p+2} \\
&= n^{p/2-1}.
\end{aligned}$$

   [1M] Here we use that $\{0\}$ is a λ-null subset of $[0,1]$ (so values of X_n here have no effect on the integral) [1J] and that $X_n(\omega) = 0$ when $\omega > \frac{1}{n}$. [1J]

   Noting that $n^{p/2-1} \to 0$ if and only if $p < 2$, we have that $X_n \stackrel{L^p}{\to} 0$ if and only if $p < 2$. [1A]

   For the last part, I would accept "$p = 1$ works but $p = 2, 3, 4 \ldots$ does not"

4. (a) Let $(U_n)_{n \in \mathbb{N}}$ be a sequence of independent, identically distributed uniform random variables on $(0,1)$. Prove that, $\mathbb{P}[U_n < 1/n \text{ i.o.}] = 1$ and $\mathbb{P}[U_n < 1/n^2 \text{ i.o.}] = 0$.

   (b) Let $(X_n)_{n \in \mathbb{N}}$ be the sequence of results obtained from infinitely many rolls of a fair six sided dice. Prove that the (consecutive) pattern 123456 will occur infinitely often.

   Solution.

   (a) We have $\mathbb{P}[U_n \leq a] = a$. For any (deterministic) sequence (x_n) the events $\{U_n < x_n\}$ are independent, because the U_n are independent. [1J]
   Noting that $\sum 1/n = \infty$ and $\sum 1/n^2 < \infty$, we have $\sum_n \mathbb{P}[U_n < 1/n] = \infty$ and $\sum_n \mathbb{P}[U_n < 1/n^2] < \infty$. [1J]
   By the second Borel-Cantelli lemma $\mathbb{P}[U_n < 1/n \text{ i.o.}] = 1$ and by the first Borel-Cantelli lemma $\mathbb{P}[U_n < 1/n^2 \text{ i.o.}] = 0$. [1J]

(b) Let $E_n = \{X_n + i = i \text{ for } i = 1,2,3,4,5,6\}$. We have $\mathbb{P}[E_n] = (1/6)^6 > 0$. Note that E_n and E_{n+6} are independent (but E_n and E_{n+1} are not!). [1M]

We have $\sum_{n=1}^{\infty} \mathbb{P}[E_{6n}] = \sum_{n=1}^{\infty} (1/6)^n = \infty$, [1A] hence by the second Borel-Cantelli lemma we have $\mathbb{P}[E_{6n} \text{ i.o.}] = 1$. [1J]

Noting that $\{E_{6n} \text{ i.o.}\} \subseteq \{E_n \text{ i.o.}\}$, we have $\mathbb{P}[E_n \text{ i.o.}] = 1$.
